

Define Problem Statements

1. Project Problem Statement Identification

Small and medium-sized retail businesses struggle to set up and manage an online storefront efficiently due to complex setups, high subscription fees, and lack of customization. Customers demand a fast, frictionless, and secure online shopping experience.

PS-1: The Online Shopper (Convenience & Trust)

User Profile: A busy online consumer looking for a smooth retail experience.

Objective: Find and purchase items quickly across mobile and desktop.

Obstacles: Cart items disappearing on session reload, slow page loads, complex checkout pipelines, and a lack of real-time inventory checks.

Negative Consequences: Friction triggers frustration, resulting in high shopping cart abandonment rates.

PS-2: The Store Admin / Seller (Operations & Control)

User Profile: Business owner or manager handles catalog and orders.

Objective: Manage product stocks, process orders, review customer feedback, and verify sales growth metrics easily.

Obstacles: Clunky database updates, difficulty uploading assets (images), and manual order status tracking.

Negative Consequences: Operations become inefficient, leading to inventory desyncs and delayed fulfillments.

2. Targeted User Personas

Persona A: "The Convenience-Seeking Shopper" (End-User)

A busy professional, age 28, who frequently shops online. Goals include quick, friction-free purchasing, price/rating filtering, and secure checkouts.

Persona B: "The Efficiency-Focused Admin" (Store Owner / Seller)

A retail entrepreneur, age 35, running a DTC brand. Goals include real-time inventory visibility, status updates, and sales trends analyses.
